ACKNOWLEDGEMENT

First and foremost, I would like to thank our Project Teacher Dr. Shaminder Singh Sohi who guided us in doing these projects. He provided us with invaluable advice and helped us in difficult periods. His motivation and help contributed tremendously to the successful completion of the project.

Besides, we would like to thank all the teachers who helped us by giving us advice and providing the equipment which we needed.

Also I would like to thank my family and friends for their support. Without that support we couldn't have succeeded in completing this project.

At last but not in least, we would like to thank everyone who helped and motivated us to work on this project.

The Project aims to put in force sustainable systems of waste collection, segregation, and treatment along with a controlled, systematic and creative ways of reducing waste generation across the country. These practices attract lot of public and academicians objection in view of open dumping of garbage. Waste management is an important as it impacts health, environment and aesthetic society if it is not managed properly. Hence to improve quality and standard of living in the state, the Government of Andhra Pradesh (GoAP) has proposed to strengthen the Municipal Solid Waste Management system covering collection, segregation, recycling, transportation, processing and disposal with option for composting, waste to energy, disposal in all 110 urban local bodies (ULBs) in Andhra Pradesh, which is in line with national objective of SWATCH BHARATH MISSION, a prestigious project of Govt of India. The Swachh Bharat Mission (SBM) emanates from the vision of the Government articulated in the address of The President of India in his address to the Joint Session of Parliament on 9th June 2014: “We must not tolerate the indignity of homes without toilets and public spaces littered with garbage. For ensuring hygiene, waste management and sanitation across the nation, a “Swachh Bharat Mission” will be launched. Mishandling of waste can have a variety of consequences on our every day life. Besides creating an unhealthy and unhygienic living environment, it is responsible for the spread of diseases, pollution of lakes and water bodies leading to loss of biodiversity and the inefficient use of land and our resources. It is extremely important that we organize and manage the waste management sector of our country, which is an infrastructural necessity for all of the other sectors to survive.

This Project aims to organize the collection of Street Waste by setting up trashcans in all public roads .

Chapter 1: Introduction

What is Waste Management?

The term ‘**Waste Management**’ collectively means the management of waste from its inception to the final stage of disposal. Thus, as one single unit, it encompasses right from the collection, disposal, recycling, to

which the processes of monitoring and regulation, respectively belong to, along with the legal frameworks that enable the occurrence of waste management.

According to Wikipedia

“Waste management or waste disposal are all the activities and actions required to manage waste from its inception to its final disposal. This includes amongst other things collection, transport, treatment and disposal of waste together with monitoring and regulation. It also encompasses the legal and regulatory framework that relates to waste management encompassing guidance on recycling.

Okay... but what do we mean here by ‘waste?’

We all attribute the term ‘waste’ in a global manner to a number of wastes. All kinds of wastes, right from the municipal waste to agricultural waste to hazardous residues and special wastes such as sludge, health care wastes come under one umbrella. Though all of them are certain waste products, their management practices are not the same.

1.1 Problem Identification

Are you looking for a local junk removal service? Look no further. We pre-screen local companies in your area and across the United States to find the best, locally owned, fast and friendly business for your junk removal needs. We are a locally-owned company providing quality service to home and business owners in India and the surrounding areas since 2018. We specialize in removal of junk from homes, construction sites, garages, warehouses – basically anywhere you have JUNK. We do all the loading and clean-up so that you don’t have to. We take furniture, household items, old appliances, and construction debris. Just about anything! Our truck dimensions are 10 ft long x 8 ft wide x 5 ft high (15 cubic yards). You only pay for the amount of space you use on the truck. Our rate includes labor, hauling and disposal fees. Our pricing and service is hard to beat.

1.2 Task Identification

With a strong environmental commitment and belief that waste has value, Goodbye Stuff’s mission is to take all necessary steps to recycle more and landfill less. We take pride in our contribution to reduce the negative impact on the natural environment. Any items that are removed from you which are serviceable and recyclable will find a new home by being donated back to the community to those in need.

We specialize in bulk trash and junk hauling for local residents, real estate agents, and property management companies in the Los Angeles and Orange Counties. A list of our services include apartment and house trash outs, garage clean outs, bulk item pick up, carpet and baseboard removal, dumpster area sweeps, and vacant lot clean up.

Chapter 2: Literature survey

India is known as one of the most heavily settled countries in the world. It appears to be the second country to have the highest number of residents. With the total population of about expected data 1.37 billion in 2019. The management of Municipal Solid Waste (MSW) in India has encountered problems. Each year, the population grew by 3–3.5%, as this factor arises, the rate of solid waste generation also rise up to 1.3% in Aligarh city, Uttar Pradesh a large number of ingenious factors like, rapid urbanization, rapid population density, rapid commercialization, uneven living standards and also enlargement of industrialization has created destructive consequences in terms of biodegradable and non-biodegradable waste generations which are estimated at about 415 tons per day.

Let us keep our city clean”

In recent years fast population growth, increase in urbanization and industrializa-tion in India has created severe problems for solid waste management in cities. Theincreased level of consumption characteristics of

the population of cities lead to generation of enormous quantities of solid waste material. The impacts of such pollution are felt both at local, as well as, at distances from sources. Domestic and industrial discharges lead to contamination of air, eutrophication with nutrient and toxic materials which in turn lead to degradation of air, land and affect flora and fauna badly. Since olden times municipal bodies remained responsible for keeping the roads clean, collecting city garbage and to carry out its safe disposal. Most of the elected bodies of the Indian cities employ largest number of employees for the purpose of cleaning the city, but only 50–70% of the waste generated is collected by the staff keeping aside the tendency of nonworking of the employees. Many estimates of solid waste generation are available but on the average it is projected that under Indian conditions the amount of waste generated per capita will rise at a rate of 1–1.33% annually (Shekdar 1999). The traditional routine approach to solid waste management is normally municipal bodies handle all aspects of collection, transport and disposal and this has emerged as a reality of mixed success all over the world in advanced or developing cities. The search for more efficient and economical solid waste collection agenda in most of the urban areas has taken shape adopting several directions towards better partnership with communities along with private sector combining adequate economic policies, e.g., recycling credits by paying the recycler, land-fill disposal levies at land-fill sites designed to minimize the quantity of waste being land-filled and product charges like packing tax to disallow over-packaging. Cities have a wide variety of arrangement under their control to lessen environmental burdens. Legal approach and restrictions on the quantity of pollutants a factory can discharge of minimum air and water quality standards are being particularly proved effective in monitoring pollution in many parts of the globe. The efficiency depends mainly on good enforcement capacities and proper monitoring procedures where urban growth pressures and pollution issues are far greater.

Following the onset of industrialisation and the sustained urban growth of large population centres in England, the buildup of waste in the cities caused a rapid deterioration in levels of sanitation and the general quality of urban life. The streets became choked with filth due to the lack of waste clearance regulations.^[19] Calls for the establishment of a municipal authority with waste removal powers occurred as early as 1751, when Corby Morris in London proposed that "... as the preservation of the health of the people is of great importance, it is proposed that the cleaning of this city, should be put under one uniform public management, and all the filth be...conveyed by the Thames to proper distance in the country".^[20]

Chapter 3: Design flow/Process

The implementation of this project has been divided into various phases.

- ✓ Designing of the website with html,css and javascript.
- ✓ Storing the data with database system / php.

We are a small family-owned company offering **same-day service with the convenience of online booking**. We specialize in residential & commercial cleanouts, furniture & appliance removal, demolition services, dumpster rental and much more.

Design phase starts with the conceptual design in the baseline spiral and involves architectural design, logical design of modules, physical product design and final design in the subsequent spirals.

Control – our community agree on a single, suitable place to dispose of waste, and to stop burning and open dumping in communal areas and on common land. This means you need to organise as a community and agree rules.

Contain – the disposal site is in an organised way, only using one area at a time. Agree which part of the site this is and ensure that there is good access to this area. Once one area is filled, cover it and move onto the next.

Cover – waste in the site is always be covered with earth at the end of each day to control odour, prevent it blowing away with the wind, and ensure it is not eaten by livestock or vermin, nor used by flies and mosquitoes to breed .

Distance: the landfill is far enough from wells and streams to protect water supplies from contamination, far enough from dwellings to prevent causing a nuisance, and close enough to the source of the waste to avoid excessive transport. If you are making a landfill site for one house or compound, it should be at least 30 metres, preferably downhill, from wells and streams. A community landfill should be at least 200 metres, preferably downhill, from wells and streams and at least 200 metres from the nearest dwelling.

HOW CAN WE CLEAR YOUR CLUTTER?

We offers !!

CLEAN OUTS

Home Clean Outs, Yard Clean Up,
Attics. Garage. Crawlspace, Basements, Storage units & more

BULK TRASH

Appliance removal, Furniture Removal, Electronic disposal

DUMPSTER SERVICES

Dumpster rentals, loading & hauling

DEBRIS REMOVAL

Construction debris, Storm debris,
Wood, Drywall, Siding, etc.

DEMOLITION

Shed demolition, Awnings, Decks, Fences, Patios, Gazebos, Interior demolition, Hot tubs, Pools & more.

E-WASTE DISPOSAL

Anything electronic, Bulky TVs, Computers, Radios, Speakers, etc.

Not only this also If any of your items are in fair conditions, we will give them a second life and donate to local charities.

1. Simple

The focus of an e-commerce site should be on the products for sale. A design that's extravagant for no legitimate reason will usually do more harm than good. It will draw attention to the design of the site and away from the products.

If you browse our showcase of beautiful e-commerce websites, you'll notice that many of these sites feature a very clean design and layout. This style works well for e-commerce because it keeps the emphasis on the products instead of the design.

Simplicity in design and layout also helps to improve the user experience. Simple sites are easy to navigate and shoppers can find what they're looking for with minimal distractions or frustrations.

Couple.co uses a clean, elegant layout and design.

2. Branded

Many shoppers are influenced in their purchasing decisions by the brand. The need to establish a strong brand is important for both online and offline selling.

In the cases of stores that sell online as well as in physical locations, the website is only one part of an overall branding strategy. The website should work well with other branding efforts of the company so that customers feel comfortable on the website.

As a startup, branding should be a long-term goal. You won't have the benefit of a long history and trust that's been developed with customers. You can start by creating a strong brand image that's used consistently on your website, your social media profiles, and other marketing materials.

New Balance is a familiar brand to many people. When you visit their site, you'll see the recognizable New Balance logo in the site header, and the huge photo on the homepage also shows a shoe emblazoned with the logo.

3. High-Quality Photos and Images

Selling online is different than selling in a physical store because the buyer cannot touch the product or see it in person before making a buying decision (unless they've seen it somewhere else).

Providing quality photos that accurately portray the product can help overcome this challenge and can make the buying decision easier for visitors.

Ideally, product detail pages should include several high-res photos for each product. Shoppers may want to see different sides or angles of the product. The more they can see, the better they'll feel about buying a product they haven't been able to see in person.

The quality of photos and images is also critical because visitors will judge your company and your products based on these visuals. High-quality images will give the impression of a high-quality product.

Gogoro Eeyo uses very high-quality product photos on its site. Viewers can see photos of the bikes from the driveside, front, rear, and 3/4.

4. Social Proof

Visitors who haven't purchased from you in the past are likely to be skeptical. Any type of social proof you can provide will go a long way towards convincing visitors that you're legit.

Social proof can involve:

- **Genuine user reviews and ratings** – Today’s shoppers want to be able to read product reviews from other customers. With a platform like Shopify or BigCommerce you can easily add review functionality to your site.
- **Testimonials and quotes from customers** – Showcasing customer testimonials on your website can also help to build trust with visitors. Including a photo of the person providing the testimonial will help to make it feel more genuine and authentic.
- **Media coverage or recommendations on other websites** – Show visitors where you have been featured. You can gain the trust of visitors by leveraging the exposure you’ve gotten elsewhere.
- **Social proof popups** – A growing number of sites are using small notification popups for social proof. Visitors see that other people are buying your products and it helps to build trust.

Good & Proper (built with Shopify) provides user reviews on product details pages.

5. Easy to Navigate

The first requirement for selling a product online is that the shopper has to be able to find exactly what he or she is looking for. Effective navigation is important to any website, but it’s especially critical for e-commerce sites. Lost visitors will result in missed sales, so every effort should be made to have a site with clear, logical navigation.

E-commerce sites often face considerable challenges with navigation due to the number of products presented on the site. Large sites, like department stores, have to be especially careful with navigation because finding what you want will usually become increasingly difficult with more options. Many e-commerce sites use mega menus so visitors are able to find exactly what they want in a quick and efficient manner.

One factor to consider is *how* the average visitor will attempt to find a particular product. What makes sense to the designer or to the company owning the site may not be the same path that the average visitor would take to find a product. Sufficient user testing is extremely helpful for identifying potential navigational issues.

Navigation can also be aided with features like a good sitewide search along with filtering and sorting options. The filtering and sorting may be applicable for browsing categories of products in addition to the site search results.

Other features like related products, lists of top selling products, and breadcrumbs can help with navigation, in addition to having an effective menu.

Aside from a dropdown menu, Anne Klein offers several filtering options to help customers find exactly what they’re looking for.

6. Easy Checkout

User experience on e-commerce sites is critical to success. If the checkout process involves too many steps or is confusing, shoppers will wind up abandoning their cart with items left unpurchased.

Ideally, the checkout should involve a minimal amount of steps and should be as easy as possible for shoppers. Don’t force visitors to create an account in order to checkout. And if they do have to create an account, be sure it involves no extra steps aside from creating a password.

Lots of user testing and generating feedback can help to create an effective checkout process. The easy solution here is to use a platform like Shopify, BigCommerce, or SendOwl that provides you with a user-friendly checkout experience by default.

7. Mobile-Friendly

Mobile e-commerce accounts for about 45% of all e-commerce in the US (source). An effective e-commerce site today **MUST** be mobile optimized to allow visitors to purchase from their smartphone or tablet.

Several of the details we've already covered (including simplicity, ease of navigation, and an easy checkout) are also critical for the mobile user's experience.

Make sure your site functions well on mobile devices. Again, this is easy if you're using a platform like Shopify or BigCommerce.

The website of Red Clay Hot Sauce (built with Shopify) looks great, even on a small screen.

8. User-Focused

Everything about an e-commerce website should be done with the user in mind. The success of the site and business depends on visitors being able to find the products that interest them, get the details they need to make a buying decision, and easily complete the purchase. Aim to make the entire process as easy as possible for visitors.

How to book ??

Booking your area junk is not that tough with Goodbye Stuff.

The project design is a part of the implication that can be used to improve the waste management of a locality. All the technical aspects have been thoroughly designed keeping all the constraints in mind.

The project resolves around whether the project will be able to meet the future needs of the users.

Basically this project is a website where the user will be able to send the location of his/her locality so that out site members can go and collect the garbage in that particular area. Garbage and recycling pickup work is physically demanding and it exposes workers to a number of occupational hazards.

This project as named implies is designed to fulfill the task of collecting garbage from certain places and then dispose it at a single place from where the garbage could then be taken for disposal or process of recycling.

Chapter 4 Results analysis and validation

At Waste Pro, we are committed to providing reliable and responsible recycling and waste disposal services to our residents because we know our efforts have a direct impact on your homes and neighborhoods. Our mission is to enhance your quality of life by providing weekly curbside residential waste collection that is professional, dependable, and value-priced. We service your neighborhoods with fuel-efficient, low-emission vehicles, and our drivers are highly trained, respectful of your property, and concerned with neighborhood safety. By offering a wide range of residential sanitation solutions, we enable the customization of trash pick-up and recycling services to better fit your needs, while strengthening, protecting, and preserving the areas in which we all live.

Why Choose Us?

At 365 Disposal & Recycling we provide a variety of waste hauling and recycling solutions. Whether you need to rent a dumpster or haul your waste, we have everything you need from small projects to large construction jobs.

*“**Waste management or waste disposal** are all the activities and actions required to manage waste from its inception to its final disposal. This includes amongst other things collection, transport, treatment and disposal of waste together with monitoring and regulation. It also encompasses the legal and regulatory framework that relates to waste management encompassing guidance on recycling.”*

Advantages or Benefits of Waste Management:

As mentioned above, waste management involves the collection and disposal of both hazardous and non-hazardous wastes from all the sectors of society. We shall now look in detail the advantages of waste management or the benefits of proper garbage disposal.

1. This practice is highly lucrative:

The Journal of Waste management says that the revenues generated by the waste management would top by \$60 million by 2018. But, there are only a few people who sincerely consider this as an industry into various facets of waste management like recycling and reusing, and reap the benefits.

Now many companies are looking forward to associating themselves with this industry and are ready for a long term investment.

2. Keeps the environment clean and fresh:

Perhaps, the greatest advantage of waste management is keeping the environment fresh and neat. These waste disposal units also make the people go disease-free as all the resultant wastes are properly disposed and taken care of.

More number of waste disposal units can be placed in all the tier-1 and tier-2 cities so that the waste disposal process can be prepped up. Also a point worthy of our consideration here is that this advantage can be taken into account only if extensive and proper safety measures are implemented along with proper waste disposal techniques.

There is no use in simply implementing a half-baked technique which, if no use to both the people and the environment. This is the best effects of proper waste disposal.

3. Saves the Earth and conserves energy:

This characteristic of waste management includes specifically the recycling aspect. As recycling of waste helps in reducing the cutting down of trees. This cutting of trees is mainly done for the production of paper. Though the paperless office is the new trend that is practiced widely but with the help of recycling we can conserve energy and lower the consumption of earthly resources.

By using this method, we can use recycled waste to make quality papers rather than relying on trees. Also, recycling needs only a minimal amount of energy for utilization and complete processing. The resultant product we obtain is a renewable source of energy and is eco-friendly.

4. Reduces environmental pollution:

As explained above, waste management if done in a proper manner not only eliminates the surrounding waste but also will reduce the intensity of the greenhouse gases like methane, carbon monoxide which is emitted from the wastes accumulated.

The depth of the existing landfills and incineration will be curbed, thereby cutting down the harmful factors that affect the environment.

5. Waste management will help you earn money:

Can you believe if I say that what I have said above is absolutely true?

Yes, waste management earns you a few extra bucks every month. Actually, there are many companies which will pay you for your waste.

Right from old and used bottles to tin cans and e-wastes, all kinds of wastes are collected and paid. These wastes are then segregated according to the extent of pollution they cause to the environment and these wastes are recycled accordingly for various purposes.

There are also crash courses available which will aid you to reuse your trash. Above all, by following this method, you can create an awareness to your fellow people by earning money, which is a win-win concept.

6. Creates employment:

Again, this aspect too is unbelievable for you... right?

You may even ask how come this is possible? But in all the facets of waste management, a huge amount of labor is needed. Right from the collection to the final step of segregation, every phase needs manpower and ultimately a large number of employment opportunities get opened up.

This claim is evident from the labour statistics provided by the US government, according to which around 3.1 million new jobs are produced due to the waste management factor.

Disadvantages of Waste Management:

We have now seen the merits of waste management in detail. Let us now have a look at the disadvantages also.

1. The process is not always cost-effective:

Yes, though it may pay cash to the contributors, the truth is this process needs a lot of money, time and land to set up a plant and run. As the amount of waste that is being contributed to the waste product unit increases, so are the number of plants that process these resources.

Setting up a huge factory obviously needs a lot of money, and this management will start fetching yields only in the long run. Hence, this is not seen as a short-term lucrative investment.

While dumping more and more garbages in the landfills cause only \$50 per ton, recycling them in the proper manner will cause \$150 per ton, which is exactly triple the cost and thus many of the companies tend to switch over to the landfill method itself.

2. The resultant product has a short life:

This is also true since the resulting recycled product cannot be expected to have a durable quality. As the product itself has its origin from the remains of the other trashed waste products and heaps of partially used ones.

The recycled product, though, is eco-friendly is expected to have a shorter life span than the intended original one.

3. The sites are often dangerous:

As the waste management sites include the landfills to recycling units under its aegis, these sites are highly susceptible to fungal and bacterial growth thereby leading to various diseases.

Even the debris formation will be accelerated by such bacterial growth, which makes it totally unsafe for the workers who work there. It also causes widespread pollution and releases harmful chemicals. These chemicals, when mixed with drinking water or any other consumable item pose a high amount of danger to human health.

4. The practices are not done uniformly:

Still, a large scale of these waste management practices are done only as a small scale process and is mostly confined to residential homes, schools, and colleges and is not practiced in a uniform manner in large industries and conglomerates.

It is not even practiced globally, as the global level consists of curbing oil spills, ocean disposals and decreasing the tree felling.

5. Waste management can cause more problems:

Though waste management creates employment, it only has the ability to produce low-quality jobs. These jobs include right from sorting the garbage collector to the intensive and laborious jobs that are needed in the

factories and outlets.

Daily basis collection of garbages will make the streets look unpleasant and unhygienic leaving excess debris on the streets to rot up. Even after the successful completion of the final stage, many chemical stews will be left behind which needs to be properly and completely disposed, otherwise, they will also pose a threat to the environment which makes the ultimate purpose of waste management go redundant.

Also, in the areas where these management units are present, it is noticed that the groundwater gets affected. So, it too causes a considerable extent of water pollution and land pollution.

Chapter 5: Conclusion and future work

Despite the various new technologies that are emerging for solid waste disposal, landfilling still remains the most common solution in the northeastern Illinois region. The establishment and closure of landfills could pose a potential hazard to ground water, due to leachate seepage, and air quality due to gases released. Unless proper maintenance and management is sustained for a fairly long time (30 years), public health may be compromised as a result. Such management is costly and potentially dangerous if faulty. Thus, a safer and more sustainable approach may be minimizing the number of landfills constructed and insuring their longevity so as not to continue taking viable land for waste disposal. It is therefore critical to divert waste from landfills through reduction and recycling.

Cleaning up your town, one block at a time.

Homeowner associations and municipalities across Long Island and private residents on the East End all place their trust in Winters Bros. for safe, reliable and thorough waste removal service. With more than 200 collection vehicles, a network of operations and facilities and a highly skilled and experienced workforce, we strive to provide the highest quality residential waste collection and recycling service.

- On-time, reliable service
- 64-gallon or 96-gallon waste and recycling carts
- Single stream recycling
- Dedicated customer service team
- Discounts on dumpster rentals and containers
- Curbside and driveway service

GoodBye Stuff also provides reliable waste and recycling collection to apartment and condo complexes across Long Island. Regardless of the size of your complex, we offer a variety of container sizes and collection frequencies to suit your needs.
